7. Debt Repay

C Program

```
#include <stdio.h>

int main() {
    double principal, rate, years;
    double interest, amount, discount, finalAmount;

    scanf("%lf %lf %lf", &principal, &rate, &years);

    interest = principal * rate * years / 100;
    amount = principal + interest;
    discount = interest * 0.02;
    finalAmount = amount - discount;

    printf("%.2f\n%.2f\n%.2f\n%.2f\n",
           interest, amount, discount, finalAmount);
    return 0;
}
```

Note: Uses simple interest: interest = principal × rate × years / 100.
